THE MODERN TRIAD: UNLOCKING THE SYNERGY OF SUSTAINABILITY, DIGITAL TRANSFORMATION AND E-GOVERNANCE

-Tarun Kumar Srivastava

INTRODUCTION

In the contemporary world, 'sustainability', 'digital transformation', and 'E-governance' dominate policymaking, urban planning, etc., in society. For a very long time, these three were seen as three parallel and independent concepts, with different strategic goals, different departments and budgets, such as environmentalists focusing on carbon footprint, IT specialists focusing on cloud migration and public administrators focusing on digital tax forms. There is a paradigm shift in the understanding of the concept, as there is an emergence of 'The Modern Triad', a recognition and realisation that sustainability cannot be achieved without digital tools, digital transformation cannot be achieved without a moral compass of sustainability, and neither of them could be achieved without the implementation of a modern E-governance framework.

DIGITAL TRANSFORMATION AND SUSTAINABILITY

The concept of 'Digital for Green' is an operational framework. The digital transformation provides a technological structure necessary to measure, model, and manage environmental impact. For instance, in the circular economy, manufacturers need to track materials in their life cycle under the 'take-make-waste' model. This model is not possible without the application of blockchain technologies for supply transparency, Internet of Things (IoT) sensors to monitor the performance of the product and the use of data analysis to effectively implement the recycling model.

Moreover, artificial intelligence is proving to be highly effective in the management of the energy ecosystem. The AI models predict energy demand spikes in advance and integrate

renewable sources like solar and wind, which help to reduce the dependence on fossil fuels. In agriculture, the use of drones, satellite data, water irrigation systems, fertilisers, pesticides, etc., helps in greater production of crops with high level of efficiency and less expense. Sustainability cannot be achieved without digital tools.

SUSTAINABILITY AS THE PURPOSE OF DIGITAL TRANSFORMATION

In the same way, digital transformation needs sustainability to make sure that it does not create more problems than solutions. The technology department has a major emphasis on the environmental ecosystem, such as the energy consumption of AI data centres, the growing crisis of e-waste, etc. The model of the intersection of digital transformation and sustainability is called 'Green IT'. Big tech giants are inventing and innovating energy-efficient and eco-friendly systems for algorithms, which utilise renewable energy for cloud services and adopt circular economy principles for hardware manufacturing.

Moreover, sustainability enables digital transformation to serve its highest purpose, which includes the implementation of inter-generational and intra-generational doctrine of sustainable development. A technology can be used in the promotion of better ecosystem, and the preservation of biodiversity.

E-GOVERNANCE AS THE ROADMAP

If digital transformation is the engine of the vehicle, sustainability is the destination then E-governance is the wheel of the vehicle or the roadmap. The state has the power to formulate standards, create incentives and build foundational digital public infrastructural (DPI) framework, that makes to possibly implement digital transformation and sustainability into the ecosystem. E-governance is to build a framework that uses digital technology to fundamentally re-engineer the relationship between the state, the citizen and the environment.

E-governance includes policy enforcement through data, where E-governance allows the state to monitor environmental compliance in real time. For instance, using satellite technology, the state can detect environmental degradation, water pollution, illegal deforestation, etc., and allows surveillance, which was difficult during the period of physical audits. E-governance is based on transparency and accountability, as publishing open data on emissions, the usage of resources, and the spending of the government on green projects allows citizens to hold the government accountable if there is comprise in compliance of green model of sustainable development. The state implements incentives for the eco-friendly model of adoption and taxes

the unsustainable model of development, which also allows and enables the sustainable choice for citizens and businesses.

SMART CITIZENS AND CITIZEN CENTRISM

The foundation of the modern triad model lies in the implementation of sustainable smart cities. The e-governance platforms engage citizens to participate in the urban planning system. The digital transformation provides a platform for LoT sensors and digital twins to model the flow of the city. Further technological innovation and invention lie in the proper implementation of transport systems to reduce emissions, manage the waste of the cities and ensure efficient water usage. The digital transformation must not increase the digital divide or undermine social sustainability. E-governance should be used to increase accessibility of technology and not to create bureaucratic roadblocks.

CONCLUSION

The challenge of the contemporary world is climate change, resource scarcity, social inequality, etc., which are too complex to be solved by conventional structural frameworks. The Modern Triad provides a holistic framework by integrating the technical power of digital transformation, the moral imperative of sustainability, and the origination and implementation through e-governance; the state could build a future which is not only efficient and high-tech but also resilient, equitable and habitable for generations to come.
